

HYPOTHETICAL INVESTMENT PORTFOLIO

A ₹1,00,000 Diversified Allocation Across Stocks, ETFs & Crypto

Prepared as part of the
CodeAlpha Finance & Investment Analysis Internship

Task 3: Investment Portfolio Creation

Prepared by: Aniket Dasharath Jadhav

Date: September 2026

1. Portfolio overview

This portfolio allocates a hypothetical ₹1,00,000 across three asset classes — direct equities (40%), exchange-traded funds (35%), and cryptocurrency (25%) — designed to balance growth, diversification and risk. Individual assets were selected using the company- and sector-level research already completed in Tasks 1 and 2 of this internship.

Asset Class	Assets	Allocation	Amount
Stocks	Tata Motors, Sun Pharma, Bharti Airtel	40%	₹40,000
ETFs	Nifty 50 BeES, Nasdaq 100 ETF, Gold BeES	35%	₹35,000
Crypto	Bitcoin, Ethereum, Solana	25%	₹25,000

Portfolio Allocation by Asset Class

2. Allocation Rationale

- Stocks (40% — highest weight): Tata Motors, Sun Pharma and Bharti Airtel span three non-overlapping sectors (autos, pharma, telecom), each with a distinct growth catalyst identified in Task 1 — a post-demerger re-rating, the Organon acquisition, and ARPU/tariff-driven earnings growth respectively. Direct equity is weighted highest for its long-term growth potential and (relatively) lower volatility than crypto.

- ETFs (35% — diversified core): Nifty 50 BeES gives broad, low-cost Indian large-cap exposure (0.03% expense ratio). The Nasdaq 100 ETF adds US tech diversification so the portfolio isn't solely dependent on Indian markets. Gold BeES acts as a defensive hedge that has historically moved somewhat independently of both equities and crypto.
- Crypto (25% — growth/speculative sleeve): Bitcoin, Ethereum and Solana are weighted 45/30/25 within this sleeve (consistent with the risk-tiered approach from Task 2), tilting toward Bitcoin's comparatively lower volatility while retaining upside exposure to Ethereum and Solana. This sleeve is capped at a quarter of the portfolio given crypto's 41-80% realized volatility versus single-digit-to-teens for the equity/ETF sleeve.

3. Risk Management & Key Takeaways

- No single holding exceeds 15% of total portfolio value, limiting concentration risk.
- The ETF + gold sleeve (35%) acts as a stabilizing counterweight to the higher-volatility stock and crypto sleeves.
- This allocation suits a moderate risk profile — growth-oriented but not aggressive — and can be tilted more conservative (raise ETF/gold weight) or more aggressive (raise crypto weight) based on individual risk tolerance and time horizon.
